Location: Japan
Program: Temporary Housing

DLT Permanent Timber Temporary Housing

This is a timber temporary housing project constructed in the aftermath of the Noto Peninsula earthquake that occurred on January 1, 2024. Designed with permanent use in mind, the houses were built using Dowel Laminated Timber (DLT)—where panels made by connecting lumber with wooden dowels are assembled into box shapes and stacked in a staggered manner, enabling rapid construction. Typically, temporary housing is provided for two years. However, this project is designed to allow the housing to be used as permanent residences. Nine housing units with 135 households, in a park near Mitsukejima in Suzu City, and three units with 31 households, in Wajima City are being constructed.

Construction of DLT Permanent Timber Temporary Housing in Mitsuke-jima, Suzu

On June 20, 30 households were completed and handed over as part of the nine planned buildings (135 households). The rooms are furnished with furniture and tables. In the room, curtains by artist Tomoko Konoike have also been installed.

Location : Mitsuke Park, Suzu city, Ishikawa Prefecture

Construction : Ishikawa Federation of Construction Companies

Supply of DLT : M.HASEGAWA & CO.,LTD.

In Cooperation with: Tomoko Konoike, Washin Chemical Industry Co., Ltd., SYNEGIC Co.,Ltd., MUJI

Curtains by artist Tomoko Konoike, June 14th.

She asked people who do handicrafts to help us by sewing curtains out of fabrics they had at home and embroidering motifs inspired by Ukrainian poetry. The motifs of the artwork, inspired by Ukrainian poetry, were embroidered on the curtains.

Plan

Site Plan

Features of DLT Permanent Timber Temporary Housing

- DLT is made by lining up a row of lumber, drilling holes, and inserting wooden dowels. No glue or nails are used during this process.
- DLT is a material that is easy for local lumber companies to work with because of its simple processing process, with no gluing process and no need for large-scale manufacturing facilities.
- Staggered stacking of box-shaped units of DLT lumber enables construction in a short period of time.
- The interior will be kept as DLT without additional finishes, allowing the interior space to take full advantage of the texture and materiality of wood.
