Location: Italy, Japan
Program: Exhibition

Maison Hermès Pavilion

This Pavilion travels the world, exhibiting Hermès's interior furniture. The paper tubes used for the vertical structure are inexpensive, light, transportable and easily assembled and disassembled. The tubes are connected horizontally with MDF boards providing the double function of shelving and structural rigidity. In order to facilitate transportation, four different tube diameters were used. During transportation, the tubes can be stored inside one another, reducing both the required storage space and transportation costs.
